

Summary

An Engineer who finds broken systems — backend or frontend — assumes ownership with no direction, and fixes them at an architectural level.

Specializes in Postgres performance, Django modernization, and Vue/TypeScript platform refactoring. Proven track record of identifying organizational gaps, driving them into the roadmap, and executing end-to-end with measurable results.

Skills & Experience

Backend: Python, Django, DRF, PostgreSQL, Docker, AWS, GCP, Salt

Frontend: Vue 3, TypeScript, Tailwind, ESLint, Prettier, Sentry

Specializations: Postgres performance tuning, data modeling, API/platform design, caching, read-replica scaling, schema evolution, frontend architecture, technical mentorship

Open Source & Writing

- [Elpy](#) — Emacs Python plugin with 500k+ downloads; one of the most used Python dev tools in the Emacs ecosystem
- [Cecli](#) — AI-assisted pair programming CLI tool
- [PyGopar](#) — personal technical blog covering Python, backend systems, and engineering craft

Work Experience

Senior Software Engineer

Halliburton

Remote, USA June 2023 – Present

Backend & Database Platform Ownership

- **Created the database platform owner role from scratch** — identified the organizational gap, assumed full ownership across multiple backend services, defining performance standards, upgrade strategy, and reliability practices for multi-terabyte Postgres systems.
- Identified auth middleware as the #1 query time contributor across 3M+ calls → refactored to caching, **eliminating lock contention platform-wide**.
- Independently identified performance bottlenecks in a multi-terabyte Postgres system through query and schema analysis; drove them into the roadmap, and led execution → **85–98% latency reduction across critical endpoints**.
- Owned end-to-end PG12→15 + Timescale upgrade — scoped independently, defined work breakdown, created all tickets, and led execution → **warm queries ~63% faster, cold ~43% faster**.
- Led modernization of two legacy Django backends — identified structural debt, made the case for restructuring, and drove CI/CD adoption → **+50% deployment frequency & -40% production bugs**.
- Authored Postgres performance standards and Django model design guidelines in Confluence; adopted as the org-wide reference across teams outside immediate domain.
- **Improved engineering throughput 20%+ and cycle time 25%+** by establishing team-wide standards, review practices, and mentoring a 4-engineer team.

Frontend Platform Ownership

- Took sole ownership of a fragile ~30k LOC Vue/TypeScript frontend — re-architected from tightly coupled MVP to Pinia store patterns → **58% reduction in API calls**, improving frontend performance and backend load simultaneously.
- Drove incremental ESLint/Prettier/Tailwind rollout using branch-scoped linting strategy; integrated Sentry, expanded CI coverage, and established testing and architecture standards — all adopted by 4 engineers with zero friction.
- Owns the frontend roadmap end-to-end — authors epics, prioritizes tech debt, and executes independently.

Co-Founder & CTO

Stealth Startup

Remote, USA Jan 2023 - June 2023

- Served as technical co-founder for an agriculture labor marketplace — an Indeed for farm workers in an underserved market with no established tech players.
- **Owned all architecture decisions, stack selection, and full-stack engineering from 0→1**; managed and mentored one junior engineer focused on frontend.
- Took product to market with a working MVP; identified core adoption blockers through direct user validation. Wound down after 6 months with clear market insight.

Core Integration Software Engineer

Color Health

Remote, USA Aug 2022 – Jan 2023

- Took ownership of a high-priority scheduling workflow redesign — customers were unable to easily reschedule appointments, driving repetitive support requests → **67% reduction in cancellations and support load**

Growth Software Engineer

StyleSeat

Remote, USA Aug 2021– Aug 2022

- Built backend systems for targeted engagement (Segment/Braze) + improved SSR → **+6% organic traffic**.
- Contributed to security vulnerability triage for an active bug bounty program — reviewed incoming reports, assessed severity, and coordinated remediation priorities
- Served as Scrum Lead for the engineering team — facilitated sprint planning, retrospectives, and delivery coordination across the team

Lead Integration Software Engineer

Data Theorem

Palo Alto, CA, USA Jan 2017 - Jan 2021

- Built and owned the company's only near real-time pub/sub integration backend — the most customizable in the market, particularly on Jira, where competitors offered bare-bones solutions.
- Grew from junior engineer to Lead Integration Engineer over 4 years driving adoption and customer satisfaction across enterprise accounts.

Education

B.S. Computer Science, CSU Monterey Bay, USA.
